- (i) What are these type of vacancy defects called?
- (ii) How is the density of a crystal affected by these defects?
- (iii) Name one ionic compound which can show this type of defect in the crystalline state
- (iv) How is the stoichiometry of the compound affected?

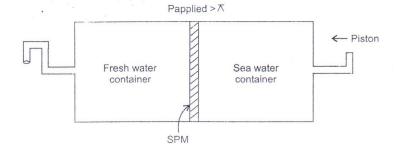

2

10. Analysis shows that a metal oxide has the empirical formula  $M_{0.96}$  O  $_{1.00}$ . Calculate the percentage of  $M^{2+}$  and  $M^{3+}$  ions in this crystal?

## OR

In an ionic compound the anion (N ) form cubic close type of packing. While the cation  $(M^+)$  ions occupy one third of the tetrahedral voids. Deduce the empirical formula of the compound and the coordination number of  $(M^+)$  ions.

11. Given below is the sketch of a plant for carrying out a process.

- (i) Name the process occurring in the above plant.
- (ii) To which container does the net flow of solvent take place?
- (iii) Name one SPM which can be used in this plant.
- (iv) Give one practical use of the plant.

2

- 12. Write the chemical equations for all the steps involved in the rusting of iron. Give any one method to prevent rusting of iron.
- 13. A metal ion  $M^{n+}$  having  $d^4$  valence electronic configuration combines with three didentate ligands to form a complex compound. Assuming  $\Delta_0 > P$ .
  - (i) draw the diagram showing d orbital splitting during this complex formation.
  - (ii) write the electronic configuration of the valence electrons of the metal  $M^{n+1}$  ion in terms of  $t_{2q}$  and  $e_q$ .
  - (iii) what type of hybridisation will M<sup>n+</sup> ion have?
  - (iv) name the type of isomerism exhibited by this complex.

2

- 14. A mixed oxide of iron and chromium  $FeOCr_2O_3$  is fused with sodium carbonate in the presence of air to form a yellow coloured compound (A). On acidification the compound (A) forms an orange coloured compound (B), which is a strong oxidising agent. Identify
  - (i) the compounds (A) and (B)
  - (ii) write balanced chemical equation for each step

2

An optically active compound having molecular formula  $C_7H_{15}Br$  reacts with aqueous KOH to give a racemic mixture of products. Write the mechanism involved for this reaction.

- 16. Write the formula of main product formed in the following chemical reactions.
  - (i)  $(CH_3)_2CH-CI$   $\xrightarrow{Na}$  Dry ether
  - (ii)  $CH_3Br + AgF \xrightarrow{\Delta}$

  - $(iv) \qquad \stackrel{N_2CI}{\longleftarrow} \qquad \underbrace{Cu/HCI}$

2

- 17. Differentiate the following pair of polymers based on the property mentioned against each.
  - (i) Novolac and Bakelite (structure)
  - (ii) Buna-s and Terylene (intermolecular forces of attraction)

2

- 18. In order to wash clothes with water containing dissolved calcium hydrogencarbonate, which cleaning agent will you prefer and why: soaps or synthetic detergents? Give one advantage of soaps over synthetic detergents. 2
- 19. Heptance and octane form an ideal solution at 373 K, The vapour pressures of the pure liquids at this temperataure are 105.2 KPa and 46.8 KPa respectively. If the solution contains 25g of heptance and 28.5g of octane, calculate
  - (i) vapour pressure exerted by heptane
  - (ii) vapour pressure exerted by solution
  - (iii) mole fraction of octane in the vapour phase.

3

20. The following chemical reaction is occurring in an electrochemical cell.

$$Mg(s) + 2 Ag^{+} (0.0001 M) \longrightarrow Mg^{2+} (0.10M) + 2 Ag(s)$$

The F 0 electrode values are

$$Mg^{2+} / Mg = -2.36 V$$

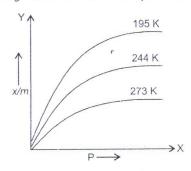

$$Ag^{+}/Ag = 0.81 V$$

For this cell calculate / write

- (a) (i)  $E^{O}$  value for the electrode  $2Ag^{+}$  / 2Ag
  - (ii) Standard cell potential E<sup>o</sup><sub>cell</sub>
- (b) Cell potential (E)<sub>cell</sub>
- (c) (i) Symbolic representation of the above cell.
  - (ii) Will the above cell reaction be spontaneous?

3

21. Consider the adsorption isotherms given below and interpret the variation in the extent of adsorption (x/m) when

(b)	Name the catalyst and the promoter used in Haber's process for manufacture of ammonia.	3
(a) the (b) the	int for the following facts are reduction of a metal oxide is easier if the metal formed is in liquid state at the temperature of reduction of $Cr_2O_3$ with AI is thermodynamically feasible, yet it does not occur at room temperature oil is used in froth floatation method.	
(a) tra (b) ch	n the following facts ansition metals act as catalysts. romium group elements have the highest melting points in their respective series. ansition metals form coloured complexes.	3
(a) Gi	ve a chemical test to distinguish between the following pairs of compounds. $OH \qquad OH$	
(ii)	$CH_3$ — $CH$ — $CH_3$ and $CH_2OH$ $OH$	
(b) W	'hy is phenol more acidic than ethanol?	3

- Account for the following observations 25.
  - (i) among the halogens F2 is the strongest oxidising agent?

(i) temperature increases at constant pressure

(ii) pressure increases at constant temperature

(a)

22.

23.

24.

- (ii) fluorine exhibits only 1 oxidation state whereas other halogens exhibit higher positive oxidation states also.
- (iii) acidity of oxo acid of chlorine is

3

3

- (a) Give plausible explanation for each of the following. 26.
  - (i) The presence of a base is needed in the ammonolysis of alkyl halides.
  - (ii) Aromatic primary amines cannot be prepared by Gabriel phthaliminde syntheses.
  - (b) Write the IUPAC name of

$$\begin{array}{ccc} CH_3 & N & C & CH_3 \\ & \parallel & \parallel \\ & C_2H_5 & O \end{array}$$

3

An optically active compound having molecular formula  $C_6H_{12}O_6$  is found in two isomeric forms (A) and (B) in 27. nature. When (A) and (B) are dissolved in water they show the following equilibrium.

[A] 
$$\Longrightarrow$$
 Equilibrium mixture  $\Longleftrightarrow$  [B]  $[\alpha]_{D} = 111^{\circ}$   $52.2^{\circ}$   $19.2^{\circ}$ 

- (i) What are such isomers called?
- (ii) Can they be called enantiomers? Justify your answer.
- (iii) Draw the cyclic structure of isomer (A)

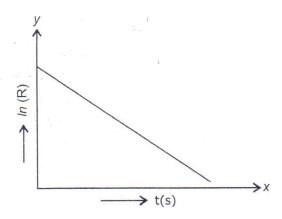

3

An optically active amino acid (A) can exist in three forms depending on the pH of the medium. If the molecular formula of (A) is  $C_3H_7NO_2$  write

- (i) structure of compound (A) in aqueous medium. What are such ions called?
- (ii) In which medium will the cationic form of compound (A) exist?
- (iii) In alkaline medium, towards which electrode will the compound (A) migrate in electric field?

3

28. For a certain chemical reaction variation in the concentration in [R] vs. time (s) plot is given below.

For this reaction write / draw

- (i) what is the order of the reactions?
- (ii) what are the units of rate constant k?
- (iii) give the relationship between k and  $t_{_{1/2}}$  (half life period)
- (iv) what does the slope of the above line indicate?
- (v) draw the plot  $log [R]_0/[R]$  vs time t(s)

5

For a certain chemical reaction

The experimentally obtained information is tabulated below.

Experiment	[A] <sub>0</sub>	[B] <sub>0</sub>	Initial rate of reaction		
1	0.30	0.30	0.096		
2	0.60	0.30	0.384		
3	0.30	0.60	0.192		
4	0.60	0.60	0.768		

OR

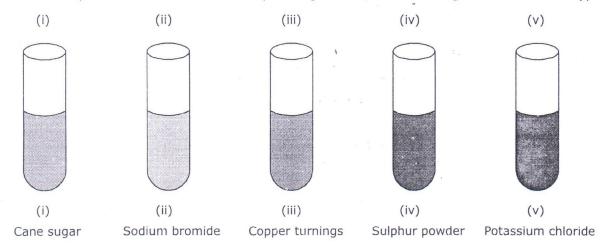

For this reaction

- (i) derive the order of reaction w.r.t. both the reactants A and B.
- (ii) write the rate law.
- (iii) calculate the value of rate constant k
- (iv) write the expression for the rate of reaction in terms of A and C.

5

OR

Concentrated sulphuric acid is added followed by heating to each of the following test tubes labelled (i) to (y)

Identify in which of the above test tube the following change will be observed. Support your answer with the help of a chemical equation.

- (a) formation of black substance
- (b) evolution of brown gas
- (c) evolution of colour less gas
- (d) formation of brown substance which on dilution becomes blue.
- (e) disappearance of yellow powder along with evolution of colourless gas.

5

30. Identify the unknown organic compounds (A) to (E) in the following series of chemical reactions.

(i) 
$$CHC_6H_5 \xrightarrow{1. O_3} (A) + (B)$$

(ii) 
$$(A) + (B) \xrightarrow{\text{dil. NaOH}} (C) + H_2C$$

(iii) (C) 
$$\frac{1. O_3}{2. Zn/H_2O} \rightarrow (A) + (D)$$

 $(D) \xrightarrow{H_2/Ni} E$ (iv)

An organic compound (A) having molecular formula C9H10O forms an orange red precipitate (B) with 2, 4 - DNP reagent. Compound (A) gives a yellow precipitate (C) when heated in the presence of iodine and NaOH along with a colourless compound (D). (A) does not reduce Tollen's reagent or Fehling's solution nor does it decolorise bromine water. On drastic oxidation of (A) with chromic acid, a carboxylic acid (E) of molecular formula C<sub>7</sub>H<sub>6</sub>O<sub>2</sub> is formed. Deduce the structures of the organic compounds (A) to (E).
